

ABSTRACT

A computer-implemented method of searching for particular data includes receiving a query from a user for particular online data content, searching for the particular online data content at least within data content locations that have been previously accessed by the user, presenting to the user search results satisfying the query. In the presentation of the search results search results corresponding to data content locations that have been accessed previously by the user are distinguished from search results corresponding to data content location that have not been accessed previously by the user.
